A-Series envelopes are constructed from 20 gores. Each gore is built-up from a number of nylon panels which are identified by letters. The row of panels around the base of the balloon, immediately above the fire resistant Nomex mouth, are 'A' panels. 'A' is followed by 'B' with the series continuing upwards. The number of panels varies depending on envelope size, and this can affect the appearance of a colour scheme - especially spiral or block designs. The location of the equator also changes, and this can significantly influence the positioning of any artwork.

A Lock-Top parachute is standard on the A-300 - A-315. This is constructed from 20 panels that radiate from a centre patch. A velcro rip-panel is standard on larger sizes. A fast deflation system is available on all sizes.

There is no extra charge for changes of fabric colour at any of the lines shown on the chart if the colours are from the standard Cameron range.
